

Choose what the tag should open.

A quick setup sheet for a diaper bag contact tag. Decide who will use the page before you connect a public-facing tag to any information.

Who is this page for?

Finder of a misplaced bag	☐ Parent contact route selected
Approved caregiver	☐ Caregiver information is in a separate, access-controlled destination

Check the destination before you encode the tag

- ☐ The page matches the person who will tap the tag.
- ☐ The destination does not reveal information to a broader audience than intended.
- ☐ The caregiver route is not exposed on the finder-facing page.
- ☐ The owner knows how to change, disable, or replace the link if needed.
- ☐ The NFC tag has been tested while attached to the bag.

Keep off a public finder page

- ☐ Child full name or photo
- ☐ Home address, regular schedule, or current location
- ☐ Health details, care instructions, or emergency information
- ☐ Personal phone numbers or email addresses without consent

Important: A clear holder and a small NFC coin do not provide access control. Anyone able to tap the tag may reach its destination. Do not put caregiver-only instructions on a finder page. A private route exists only if the destination service provides and correctly applies the access settings you need.

This worksheet contains setup prompts only. Do not write private contact or child information on this copy if other people can see it.
