

Care Circle Handoff Map

Put the useful detail near the person and moment that need it.

Start with one handoff that repeats. Choose a physical place, the parent-selected page it should open, and the person who keeps that page current.

Map the handoffs

HANDOFF OR ITEM	HELPER WHO NEEDS IT	PHYSICAL PLACE	SELECTED LINK OR PAGE	INFO OWNER	REVIEW DATE

Before you share a link

- ☐ Does this helper need the whole page, or only one useful detail?
- ☐ Who can open the destination, and who will update it when the routine changes?
- ☐ Have you kept passwords, alarm codes, financial details, and sensitive medical information off broadly shared pages?
- ☐ Did you check the page's own sharing settings before giving out the link?

Keep the boundary clear. An NFC tag opens a selected link when tapped. The tag does not track people, verify who is tapping, or control access to the linked page.

Use this map to plan links and responsibilities. Keep the page itself in a service you control, with sharing settings that fit the helper.
