

Sample Point Access Map

Plan the link before the tag reaches the field. Use one sheet for each approved sampling location.

Purpose: make the right site map, project instruction, or field form easier to reach at the point of work.

01 Name the access point

Site or sample-point reference (use an internal code)

Project or team

Keep precise coordinates and confidential project details in the authorized system, not on a public-facing tag or worksheet.

02 Choose the destination

Approved map, instruction, or form URL

Resource owner

03 Check access with the field team

☐ Intended phone opens the destination	☐ Required sign-in and permissions are clear
☐ Coverage or offline limits are understood	☐ Approved fallback is available
☐ Marker and attachment point are approved	☐ Intended users know what the link opens

04 Set the review and fallback

Review date

Fallback route or contact

This is an access-planning aid. It is not a sampling protocol, sample label, collection record, chain-of-custody document, results record, or compliance form. The tag opens the destination; your field program remains responsible for procedures and records.
